The diagram shows the LIS2DH12 sensor module (U4) with the following connections:

- Pin 9:** VDD
- Pin 10:** VDD, VDD - I/O
- Pin 5:** RES(GND)
- Pin 6:** GND
- Pin 7:** GND
- Pin 8:** GND
- Pin 12:** ACC_INT1
- Pin 11:** ACC_INT2
- Pin 2:** SPL_ACC_CS
- Pin 4:** SPI_MOSI
- Pin 3:** SPI_MISO
- Pin 1:** SPI_SCK

A capacitor C18 (4u7) is connected between VDD and GND.

Bosch BME280 = Pressure + humidity + temperature (2.5mm x 2.5mm x 1mm)

Average current consumption (1Hz data refresh rate):
 1.8 μ A @ 1 Hz (T, P)
 2.8 μ A @ 1 Hz (P, H)
 3.6 μ A @ 1 Hz (H, T)

Average current consumption in sleep mode 0.1 μ A

ANTENNA

C19

NA

GND

Shunt capacitor or inductor. For convenience, a shunt capacitor is preferred.
A shunt cap. be removed without changing the rest of the circuit and a capacitor is cheaper than an inductor.

Pin connection diagram for the TC2030 microcontroller. The diagram shows the TC2030 chip with pins 1 through 6. Pin 1 is connected to +BATT. Pin 2 is connected to SWDIO. Pin 3 is connected to RESET. Pin 4 is connected to SWDCLK. Pin 5 is connected to GND. Pin 6 is connected to SWO. The RESET pin is also connected to a TP P19, TP P20, and TP P21.

Nordic Semiconductor's 1/4 wavelength monopole antenna design guide states:

When implementing the monopole as a trace on the PCB, the length of the trace should be extended somewhat to allow for some fine-tuning of the antenna to the desired frequency of operation. The ideal size and the antenna trace is uniformly suspended from the PCB substrate, then the length of the trace should be extended by about 20%. If the ground plane size is considerably smaller than the ideal size and/or much of the antenna trace is placed close to the edge of the PCB, then the length should be extended by about 30%.

Theoretical length $L = \frac{92mm}{4} = 23mm \approx 23mm \times 1.3 = 30mm$.

There are the following two methods to tune an antenna:

- If the physical dimensions of the antenna can be altered, for example, with PCB antenna, adjusting the length will be one part of the tuning.
- Another place to tune the antenna is the impedance towards the 50 ohm center point.
- If the antenna cannot be altered physically, more external components must be used to tune the antenna.

These external components are called the matching network.

If it is not possible to get the impedance exactly 50 ohm by adjusting the length of the antenna, a component must be used to pull the impedance to the 50 ohm point. We prefer to use a small capacitor since it is easier to tune and the capacitor component can be removed without any impact.

For more info, check Nordic Semiconductor's White Paper about antenna tuning: Google "nfp-017.Antenna.Tuning"
