Pressure + Humidity + Temperature

Bosch BME280 = Pressure + humidity + temperature (2,5mm \times 2.5mm \times 1mm) Average current consumption (1Hz data refresh rate): 1.8 $\mu A \oplus 1$ Hz (H, T)

Average current consumption in sleep mode 0.1 μ

Nordi: Semiconductor's 1/A wavelength monopole antenna design guide states:
when implementing the monopole as a trace on the PCB, the length of the trace should be extended somewhat to allow for some file—funling of the antenna to
resonance at 2.45GHz, if the size of available ground plane is approaching the ideal size and the antenna trace is uniformly surrounded by the PCB substrate, the
length of the trace should be extended by about 20%. If the ground plane size has considerably smaller, than the ideal size and/or much of the antenna trace.

Theoretical length: L = 92mm / 4 = 23mm -> 23mm * 1.3 = There are the following two methods to tune an antenna:

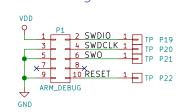

If the physical dimensions of the antenna can be altered, for example, witha PCB antenna, adjusting the length will be one part of the tuning.
 Another part is to add a component, inductor, or capacitor, to pull the antenna impedance towards the 50 ohm center point.

f the antenna cannot be altered physically, more external components must be used se external components are called the matching network.

If it is not possible to get the Impedance exactly 50 ohm by adjusting the length of the antenna, a component must be used to pull the Impedance to the 50 ohm point is preferable to use a shund capacitor since a capacitor is chapter than an inductor and because a shund component can be removed without any Impact.

For some 16th, bright Component Componen
